Mars-opt.cpp

////////////////////////////////////

```
/* mars.c optimized C code - copyright(c) 1998 IBM
*
* This code implements both the NIST high level C API (version 5)
* and an underlying IBM defined low level (DWORD oriented) C API.
*/

/* Revisions log:
*
* Aug 1999, Shai - the "tweaked" key schedule
* Apr 1998, Dave & Shai - new key scheduling, new sbox, NIST API
* Mar 1998, Shai Halevi - adapted to the latest variant of mars
* Feb 1998, Dave Safford - created
*/

/* Compilation using pcg's version of gcc:
* gcc -Wall -pedantic -c -O6 -fomit-frame-pointer -mcpu=pentiumpro
* -DINTEL_GCC tests.c mars-opt.c
*
* Compilation using xlc on AIX:
* xlc -c -O3 -DAIX_XLC mars-opt.c
*
* Compilation using Borland C++ 5.0 from a DOS command line:
* bcc32 -Oi -6 -v -A -a4 -O2 -DKAT tests.c mars-opt.c
*
* Useful compilation defines:
* NO_MIX - do not execute the mixing phases (core only)
* INTEL_GCC - optimized for pentiumpro and djgpp/gcc compiler
* AIX_XLC - optimized for powerpc/AIX with xlc compiler
* SWAP_BYTES - force endian conversion (eg __BYTE_ORDER not supported)
* IVT - add intermediate values test outputs (this slows
* down encryption and decryption significantly)
*/
#include "stdafx.h"
#include "aes.h"

/* The low level mars routines are completely DWORD oriented, and
* endian neutral. The high level NIST routines provide BYTE oriented
* inputs and outputs, thus raising the endian issue when converting
* between BYTES and DWORDs. For these conversions, mars assumes
* little endian order. On a big endian machine, we define BSWAP()
* to do the conversions. BSWAP() is about the best you can do in C.
* Real implementations will undoubtedly use inline ASM, as most risc
* machines can do this in one instruction.
*
* Make a best guess on platform endianness; This works on linux, AIX,
* and W95. For other platforms, you may have to manually define SWAP_BYTES
* on a big endian machine if this guessing doesn't work.
*/
